Authority

CaSA WEBINAR

CONTROLLING AI, DATA, INTEGRATION & AUTOMATION PROGRAMMES

A practical project controls toolkit

From uncertain idea to controlled, testable service

RECORDED DEMO

PRACTICAL TOOLKIT

TESTABLE OUTPUTS

TUESDAY 25 AUGUST • 12:30PM • ONLINE

FREE CaSA WEBINAR

***Certified Fellow of CaSA (FCaSA),
Fellow of Institute of Risk Management (CFIRM)***

*Member of the CaSA Southwest Regional Board,
and Nuclear Institute's Digital SIG (DIGSIG),
and past AXELOS P3M3 Assessor.*

Who We Are

DADA is an ISO9001, Cyber Essentials accredited Company Member to the Controls & Skills Authority (CaSA), amongst others. DADA were shortlisted in the Britain's Energy Coast Business Cluster (BECBC) 2023 Annual Awards, in their maiden year of membership, by National Nuclear Laboratory (NNL) in the "Innovation and Creativity" category, against companies like Bechtel and Tetra Tech. Here, they showed how they could create a SMART Construction platform to turn project data into predictive intelligence to create a "risk radar" to continuously identify hidden risks that need to be actioned on existing projects.

Delivery Evidence & Recognition

Partners

Past Clients

Recognition

What does effective project control look like when the deliverable is an AI-enabled service?

AI, data and automation is often baselined before teams understand the source data:

- system dependencies,
- operational constraints,
- acceptance evidence, or decision ownership.

Today, we show how project controls can expose uncertainty early - and turn an emerging idea into a service that can be governed, tested and stopped when evidence is weak.

What You Will See, Test and Take Away

What the session will cover: 3 Practical Take-aways:

- A practical control method
- 3 worked project-control examples
- A recorded no-code assurance demonstration
- Reusable tools and templates
- A clear accept, rework, escalate or stop decision route

01

CONTROL UNCERTAINTY

Source-data checks • dependencies
Maturity gates before baselining

02

GOVERN AI USE

Purpose • privacy • traceability
Human control • escalation routes

03

TEST THE OUTPUT

Evidence boundaries • test cases
Acceptance • human approval

From Idea to Controlled Service

3 Controls to move from promise to evidence

Control Method → Worked Example → Accountable Decision → Reusable Tool

01 / CONTROL UNCERTAINTY

CONTROL METHOD

- Define the use case and intended decision
- Check source data, interfaces and dependencies
- Apply maturity gates before fixing the baseline

WORKED EXAMPLE

Conflicting data definitions and a hidden interface dependency change the estimate.

CONTROL DECISION

REWORK THE BASELINE

TAKE-AWAY

USE-CASE & CONTROLS CANVAS

02 / GOVERN AI USE

CONTROL METHOD

- Set the permitted purpose and data boundaries
- Retain traceability and human oversight
- Define stop and escalation routes

WORKED EXAMPLE

The assistant gives a confident answer without approved supporting evidence.

CONTROL DECISION

ESCALATE THE EVIDENCE GAP

TAKE-AWAY

AI BILL OF RIGHTS + TOOLBOX TALK

03 / TEST THE OUTPUT

CONTROL METHOD

- Define evidence boundaries and test cases
- Assess accuracy, completeness and traceability
- Require named human approval

WORKED EXAMPLE

The output is well formed, but a key claim cannot be traced to an approved requirement.

CONTROL DECISION

REJECT OR REWORK

TAKE-AWAY

TEST & ACCEPTANCE SCORECARD

Control uncertainty before fixing the baseline

01 CONTROL UNCERTAINTY

Pass the Maturity Gate *before* Fixing Cost & Schedule

STARTER PACK TAKE-AWAY: Use-Case & Controls Canvas

RECORD: use case • source owner/version • dependencies • assumptions • maturity-gate decision

Govern AI use, not only the technology

Control the purpose, information, evidence, decision and audit record around **every AI-enabled task**.

02 GOVERN AI USE

Stop or Escalate

Outside the approved purpose • restricted data • unsupported claim • unresolved source conflict • no accountable approver

Project AI Bill of Rights Template

Five protections every AI-enabled project decisions should be able to demonstrate.

Control Principle: If AI influences a decision, the project must show how all of the 5 protections below are met

Project-governance charter—not a statement of legal rights. Adapted for project delivery from the White House OSTP Blueprint for an AI Bill of Rights (2022).

Use an AI toolbox talk before work starts

Seven questions establish the operating boundary before the team uses AI.

STARTER PACK TAKE-AWAY: AI Toolbox Talk Checklist

RECORD: permitted use • approved data and sources • validation method • approver • incident route • stop rule

A fluent answer is not an accepted output

Acceptance depends on evidence, traceability and named human approval.

Gates agreed before the output is reviewed

AI
Output

- **EVIDENCE BOUNDARY**
Is the claim supported by an approved source and version?
- **DEFINED TEST CASE**
What result was expected and what constitutes failure?
- **ACCEPTANCE CRITERIA**
Is the output accurate, complete, consistent and traceable?
- **HUMAN DECISION**
Has a named reviewer accepted responsibility for its use?

Control Decisions

STARTER PACK TAKE-AWAY: Four-Gate Acceptance Method

RECORD: test case • evidence source/version • criteria result • decision • named approver

Scorecards make acceptance repeatable

STARTER PACK TAKE-AWAY:
Test & Acceptance Scorecard

Run the assessment in five repeatable steps

Starter Pack turns each AI output into an evidence-based, recorded and decision.

- Any critical-control failure overrides the total score and triggers **STOP / ESCALATE**.
- If critical controls pass, the score informs **ACCEPT / ACCEPT WITH CONDITIONS / REWORK / REJECT**.
- A named human must approve and record the final decision.

STARTER PACK TAKE-AWAY:

Test & Acceptance Scorecard • Assessment Instructions • Decision Log

Use the same decision rules every time

The **total score** guides the route, but a critical failure always determines the outcome.

No output is accepted by score alone: evidence and a named human determine the final decision.

STARTER PACK TAKE-AWAY: Decision Rules • Decision and Escalation Log

RECORD: outcome • evidence references • limitations or failure • accountable owner • approval/escalation

What the recorded demonstration will test

Change-control scenarios will be tested **four ways** — then scored, decided and recorded.

Step 01 SET UP THE CONTROLLED SCENARIO

Permitted task • approved evidence pack • named approver

Step 02 RUN FOUR ASSURANCE TESTS

TEST 1 — APPROVED EVIDENCE IS PRESENT

Cite each approved source, document version, owner and date before using any supported claim.

TEST 2 — REQUIRED EVIDENCE IS MISSING

State what is unavailable, avoid assumptions, request missing evidence for controlled rework.

TEST 3 — APPROVED RECORDS CONFLICT

Expose source data conflicts, and stop until an approved position is recorded by an Approved Reviewer..

TEST 4 — REQUIRE HUMAN APPROVAL

Prepare evidence pack, name the approver and refer the decision for explicit human acceptance.

SET UP → TEST 4 CONDITIONS → SCORE → HUMAN DECISION & RECORD

AI assurance as a repeatable Project Controls method

We developed an in-house AI assurance toolbox that helps Project Controls practitioners define safe use, test outputs against approved evidence and retain human accountability—and can be adapted across cost, schedule, risk, change, reporting and assurance.

DEFINE SAFE USE → TEST THE OUTPUT → RECORD THE HUMAN DECISION
